

1.

Create a comparison table listing the main differences between DDR3, DDR4, and DDR5 RAM, including speed, voltage, and typical use cases.

Feature	DDR3	DDR4	DDR5
Generation	Older generation (2007)	Mainstream generation (2014)	Current standard (2020/2021)
Transfer Speed	800 – 2133 MT/s	1600 – 3200 MT/s	4800 – 8400+ MT/s
Operating Voltage	1.5 V (Highest power use)	1.2 V (Moderate power use)	1.1 V (Lowest power use)
Pin Count	240 pins	288 pins	288 pins(key notch shifted)

2. Open your laptop or desktop (with power disconnected), locate the RAM slots, and take a clear photo of the installed RAM module. Reinstall the RAM module and verify that your system boots up successfully. **Hint:** Refer to your device manual or a trusted YouTube guide if unsure about RAM removal and installation steps.

3. List three key differences between HDD, SSD, and NVMe storage types, and for each, name one app or use case (from apps you use daily) that would benefit most from that storage type.

1. HDD (Hard Disk Drive):

Speed: Slowest (mechanical disk)

Technology: Uses spinning magnetic disks

Cost & Capacity: Cheapest, large storage capacity

2. SSD (Solid State Drive):

Speed: Much faster than HDD

Technology: Uses flash memory (no moving parts)

Cost & Capacity: More expensive than HDD

3. NVMe SSD (Non-Volatile Memory Express)

Speed: Fastest, with very high read/write speeds

Technology: Uses flash memory with PCIe interface for maximum performance

Cost & Capacity: Most expensive, premium performance

1. HDD

- **Use case:** Storing large files such as movies, photos, and backups.

- **Example app:** File Explorer (for storing personal videos, photos, and documents).

2.SSD

- **Use case:** Everyday computing with faster boot times and quicker app loading.
- **Example app:** Microsoft Word (opens quickly and saves documents faster).

3.NVMe SSD

- **Use case:** High-performance tasks requiring very fast data access.
- **Example app:** Adobe Premiere Pro (fast video editing and loading of large project files)

4.Remove the storage drive (HDD or SSD) from your system, take a photo of the connector type (SATA, M.2, or NVMe), and reinstall the drive. Confirm that your device recognizes the storage after reassembly.

Constraint: Only perform this task if you have access to a device you are allowed to open. If not, find and share a YouTube video link showing the process for your laptop/PC model. create a img.
